

Layer 1 Project scaffold + design system

Build first ▾

- package.json React + Vite + Three.js + Capacitor dependencies declared
- vite.config.js Build config, asset handling, mobile optimizations
- src/styles/tokens.css All CSS variables — colors, spacing, radius, typography for all 5 themes
- src/styles/themes/sharad-moon.css Default theme — deep indigo, pink lotus palette
- src/styles/themes/vrindavan-dawn.css Warm rose-gold, pearl light palette
- src/styles/themes/nikunj.css Emerald bower, golden-green palette
- src/styles/themes/van-vihaar.css Forest amber, champak gold palette
- src/styles/themes/shayan.css Midnight blue, diya-glow gold palette
- src/styles/global.css Base resets, glassmorphism card classes, shared UI patterns

Nothing visible yet — just the foundation. Every future layer inherits from this.

Layer 2 Data engine — storage + business logic

Build second ▾

- src/store/db.js IndexedDB setup — DailyRecord, AppSettings, Quotes tables
- src/store/useAppStore.js Zustand global state — today's data, theme, active section
- src/logic/targetEngine.js The core formula: $T(n+1)$ calculation, missed day logic, chain recompute
- src/logic/streakEngine.js Streak calculation, consecutive day tracking
- src/logic/dayBoundary.js Effective spiritual date — handles 3-4 AM boundary crossing
- src/logic/numberFormat.js Indian number system formatter — 1,00,000 style
- src/data/quotes.js All pads from Chaturasi Ji, Sevak Vaani, Bhorī Sakhi — structured data
- src/logic/quoteEngine.js Random selection, no-repeat-within-7-days logic

Pure logic — no UI yet. This layer can be tested independently before any screen is built.

Layer 3 Background engine — frames + Three.js scene

Build third ▾

- src/engine/FramePlayer.jsx Loads frame sequences, plays them in a canvas — scroll or timer driven
- src/engine/ThreeScene.jsx Three.js canvas — orbiting ॐ text, particle system, gyroscope input
- src/engine/OrbitText.js The 3 orbiting sacred name instances at different radii and speeds
- src/engine/ParticleSystem.js Petal and sparkle particles — theme-colored, tap-reactive bursts
- src/engine/GyroInput.js Device orientation → subtle camera parallax offset

- public/frames/

Your extracted frame folders go here — referenced by FramePlayer

This layer gives the app its living, breathing quality. Built once — used by every screen.

Layer 4 Core screens — dashboard + all 6 sections

Build fourth ~

- src/screens/Splash.jsx Loading screen — golden lotus, app name, breathing animation
- src/screens/Dashboard.jsx Main screen — progress ring, input modes, checklist, streak
- src/screens/sections/NaamJap.jsx 4 input modes: quick-add, number, tap-per-jap, mala tracker
- src/screens/sections/HitChaturasi.jsx Today's pad, progress through 84, pad list with checkboxes
- src/screens/sections/MaansikSeva.jsx Seva checklist, ashtayam items, notes journal
- src/screens/sections/Prarthana.jsx Daily prayer toggle, optional text, 7-day log
- src/screens/sections/BhaktMaal.jsx Reading tracker, current chapter, streak, notes
- src/screens/sections/Charnamrit.jsx Daily yes/no toggle, monthly calendar grid, stats
- src/components/ProgressRing.jsx Animated SVG circular progress — used on dashboard
- src/components/MalaBead.jsx 108-bead visual circle, tap to advance, sumeru bead celebration
- src/components/GlassCard.jsx Reusable glassmorphism card — every card in the app uses this
- src/components/BottomNav.jsx Fixed bottom navigation — Home, Calendar, History, Settings
- src/components/SectionNav.jsx Horizontal scrollable section pills at top of dashboard

Build Dashboard first, then each section one at a time. Each section is self-contained.

Layer 5 Secondary screens — calendar, history, analysis, settings

Build fifth ~

- src/screens/Calendar.jsx Monthly grid, 4-state day colors, tap to expand day detail
- src/screens/History.jsx Tabs: today, weekly bar chart, monthly heatmap, lifetime stats
- src/screens/DayEndModal.jsx Full analysis — target vs did, streak, next target, pad quote
- src/screens/Settings.jsx All settings — theme, mantra text, reminders, audio, backup
- src/screens/ThemeSelector.jsx 5 theme cards with live preview, instant switching
- src/components/BarChart.jsx Weekly bar chart — gold fill bars, target dashed line
- src/components/HeatMap.jsx Monthly heatmap grid — intensity by completion %

These screens depend on Layer 2 data being solid. Build Layer 2 tests before starting here.

Layer 6 Platform features + APK packaging

Build last ~

- `src/services/notifications.js` 5 reminder types via Capacitor Local Notifications plugin
- `src/services/audio.js` Background audio player — reads your mp3 filename from settings
- `src/services/backup.js` Google Drive OAuth + export/import of backup.json
- `src/services/widget.js` Android widget data bridge via Capacitor
- `android/` Capacitor Android project — generated by `npx cap add android`
- `capacitor.config.json` App ID, name, webDir, plugin configs

Add platform features only after the app works fully in browser. Capacitor wraps last.
